

To Whom it May Concern,

This program was a small assignment that was assigned by my Intro to Computer Science, Professor David Liben-Nowell, to test us on data processing. The program uses definite loops to calculate different average situations and total situations in the stock market during the year 2021. In this folder attached is the assignment, which is named 'Code example assignment.' In addition, the assignment PDF, I have also attached a datafile 'MMM.CSV' Which is used in this assignment. Please make sure to download the csv file and .py file to the same directory for the program to work.
